

Nobody handles a curve quite like DesignFlo.™

Race cars have been known to hug a curve pretty well. But in the fast track world of commercial building, the new DesignFlo air distribution system from Krueger is out in front.

That's because our revolutionary DesignFlo system can be

curved, mitered, or cut to function with virtually any modern ceiling and integrate with any architectural interior.

DesignFlo was engineered with flexibility in mind. The unique design allows the core to be interchangeable through the face. This provides

you the freedom and flexibility to change the airflow pattern as you require.

DesignFlo is also a super-quiet high performance system designed to insure

high capacity air distribution. (It is however, creating quite a buzz among architects and contractors.)

And perhaps best of all, our exclusive technology offers unprecedented control over your environment, no matter how challenging your design requirements. With simultaneous control of airflow pattern and volume, this is aerodynamic performance at its best.

So take the innovative DesignFlo system out for a test drive on your next project. And put your imagination into high gear.
